
Life expectancies for individuals with cerebral palsy

Corey Plover

October 2023

1. Summary

- 1.1 This publication is intended to translate the survival probabilities and mortality loadings found within a range of epidemiological studies to implied life expectancy tables in a robust, objective and consistent manner. A summary of these calculations are provided below.

Table 1.1 - Life expectancy for cerebral palsy cohorts (additional years, relative to base population)

Study cohort	Age 0	Age 5	Age 10	Age 15	Age 20	Age 25
Crichton (1995) - Canadian population						
Cerebral palsy - Hemiplegia	95.4%	96.0%	96.5%	96.9%	97.2%	97.5%
Cerebral palsy - Other	80.7%	85.9%	89.7%	92.2%	94.0%	95.1%

- 1.2. All above estimates are non gender-differentiated life expectancies that express the fitted life expectancies for cerebral palsy cohorts relative to the base population *for that particular study*.
- 1.3. This "percentage of base" method allows the application of any cerebral palsy cohort results to any target population and can be used to adjust for country of residence, gender, or ethnicity. In particular, it can be used to adjust for prospective life expectancies accepted by the Australian High Court in their decision of Golden Eagle International Trading Pty Ltd v Zhang [2007] HCA 15.

- 1.4. An example of this is shown below and applies the cerebral palsy cohorts of the Hinwood et al (2022) study to the prospective Australian population. These figures would generally be regarded as the best estimate of life expectancies for individuals with cerebral palsy in Australia due to the recency of the Hinwood study, its specificity to the Australian population and health care outcomes, and its application of prospective population projections as per the High Court's ruling:

- 1.5. While these tables may be useful estimating the life expectancy of an individual with cerebral palsy it is crucial to recognise they are only *average* life expectancies, fitted to the cohorts involved in the particular study. Factors such as comorbidities, access to ongoing care and random outcomes have the ability to greatly affect the actual life expectancy for a particular individual.

2. Background

- 2.1 Cerebral palsy is a diagnostic label referring to motor conditions that cause physical disability in human development, chiefly in the various areas of body movement.
- 2.2 While it is not a progressive disorder (meaning the brain damage does not worsen) cerebral palsy's nature as a broad category means that the rates, trends and predictors of mortality varies widely, depending partly on the severity of each person's impairment and partly on the capability of each person to self-manage the logistics of life.
- 2.3 A number of papers have investigated the survival patterns of individuals born with cerebral palsy in different countries. These include:

3 Methodology

- 3.1 In order to achieve a robust and intuitive fit of cerebral palsy survival probabilities, a transformation was applied to population survival probabilities obtained from each relevant country of study:
- Australia - "Life Tables, States, Territories and Australia, 2014-2016", Australian Bureau of Statistics.
 - Canada - "Life Tables, Canada, Provinces and Territories, 2014-2016", Statistics Canada.
 - Japan - "Abridged Life Tables for Japan, 2016", Ministry of Health, Labour and Welfare.
 - Sweden - "Life table by sex and age. 1970-2017", Statistics Sweden.
 - United Kingdom - "National life tables, United Kingdom, 2015-17", Office for National Statistics.
 - United States - "United States Life Tables, 2014", National Vital Statistics Reports.
- 3.2 Survival probabilities up to the age specified in the respective study were transformed via a 2-parameter exponential function specified by an adjustment factor at birth, and a rate of change. These parameters were chosen to replicate survival probabilities specified in each study as closely as possible.
- 3.3 Survival probabilities thereafter were estimated via a proportional life expectancy model. Support for this approach can be found in Strauss et al's 2005 publication, "Estimation of Future Mortality Rates and Life Expectancy in Chronic Medical Conditions".
- 3.4 This approach was chosen as it closely replicates the empirical survival rates for individuals with cerebral palsy with a minimal number of parameters, while maintaining consistency with the trends published in broader literature, and reducing the sensitivity of the results to random fluctuations in observed deaths.
- 3.5. The graph below compares the mortality ratios from the Blair and Reid papers to fitted ratios under the above approach:

Graph 3.5 - Fitted mortality loading for cerebral palsy population by age (years)

- 3.6 Categorisations with 100 or fewer individuals were excluded from analysis as their sample size was deemed to be too small to overcome random fluctuations in the number of observed deaths.

4 Crichton et al (1995)

- 4.1 In their 1995 paper, Crichton et al investigated the survival patterns in persons with cerebral palsy for 3,187 individuals born with cerebral palsy in British Columbia between 1952 and 1989.
- 4.2 This paper used a clinical categorisation of cerebral palsy, epilepsy and mental retardation.

Table 4.2 - Crichton et al (1995) classification of individuals

Disability	Description
Cerebral palsy	Spastic quadriplegia and diplegia
	Hemiplegia or monoplegia
	Athetosis
	Other forms
Epilepsy	Generalized seizures
	Partial epilepsy with and without secondary generalization
	Infantile spasms
	Unclassified forms
Mental retardation	Non existent or mild
	Moderate
	Severe or profound

5 Plioplys et al (1998)

- 5.1 In their 1998 paper, Plioplys et al investigated the survival patterns in persons with cerebral palsy for 447 individuals born with cerebral palsy in Chicago between 1986 and 1996.
- 5.2 This paper used the categorisation of a earlier Californian study with additional focus on clinical parameters, the presence of other significant diseases and the use of gastrostomy and nasogastric feeding tubes.

6 Blair et al (2001)

- 6.1 In their 2001 paper, Blair et al investigated the survival patterns in persons with cerebral palsy for 2,014 individuals born with cerebral palsy in Western Australia between 1958 and 1994.
- 6.2 This paper found strong associations of survival rates with degree of intellectual deficit and motor impairment. Individuals were defined according to the following classifications:

Table 6.2 - Blair et al (2001) classification of individuals

Intellectual deficit	Description	Motor impairment	Description
Normal	IQ/DQ > 85	Minimal	Motor signs present but no functional impairment
Borderline	IQ/DQ > 70 to 85	Mild	Symptoms results in some functional impairment
Mild	IQ/DQ > 50 to 69	Moderate	Between mild and severe (ambulant with walking frame)
Moderate	IQ/DQ > 35 to 49	Severe	Little purposeful voluntary action, though function may be acquired, IQ permitting
Severe	IQ/DQ > 20 to 34		
Profound	IQ/DQ < 20		

- 6.3 Further statistical analysis was conducted on the combined impact of several coexisting disabilities. An overall disability score was derived by summing the score assigned to the following disabilities: category of movement disorder (hemiplegia = 1, diplegia = 2, other = 3), severity of movement disorder (minimal = 0, mild = 1, moderate = 2, severe = 3), severity of cognitive deficit (IQ 50 to 69 = 1, IQ 35 to 49 = 2, IQ < 35 = 3), other impairments (blindness = 1; bilateral deafness = 1; current epilepsy = 1).

7 Hutton et al (2002)

- 7.1 In their 2002 paper, Hutton et al investigated the survival patterns in persons with cerebral palsy for 1,668 individuals born with cerebral palsy in United Kingdom between 1966 and 1989.
- 7.2 This paper found that severity of cognitive, motor (manual and ambulatory), and visual disabilities have independent effects on the probability of survival.

Table 7.2 - Hutton et al (2002) classification of individuals

Disability	Description
Severe ambulation disability	Carer operated wheelchair
Severe manual dexterity disability	Unable to feed and dress
Severe cognitive disability	IQ < 50
Severe visual disability	6/60 or worse in better eye, functionally blind
Severe hearing disability	Severe bilateral disability

- 7.3 The statistical analysis of the Hutton paper concluded that severe hearing disability did not add additional information when the other four functional disability categories are included.
- 7.4 The relevant statistics from the Hutton paper are replicated below:

Severe motor, cognitive and visual disabilities, normal bw	~62%	~40%	~29%

8 Hutton et al (2006)

- 8.1 In their 2006 paper, Hutton et al investigated the survival patterns in persons with cerebral palsy for 1,647 individuals born with cerebral palsy in United Kingdom over an unspecified interval.
- 8.2 This paper found that severity of cognitive, motor (manual and ambulatory), and visual disabilities have independent effects on the probability of survival.

Table 8.2 - Hutton et al (2006) classification of individuals

Disability	Description
Severe ambulation disability	Carer operated wheelchair
Severe manual dexterity disability	Unable to feed and dress
Severe cognitive disability	IQ < 50
Severe visual disability	6/60 or worse in better eye, functionally blind
Severe hearing disability	Bilateral disability, or severe unilateral disability

- 8.3 The statistical analysis of the Hutton paper concluded that severe hearing disability did not add additional information when the other four functional disability categories are included.
- 8.4 The relevant statistics from the Hutton paper are replicated below:

9 Westbom et al (2011)

- 9.1 In their 2011 paper, Westbom et al investigated the survival patterns in persons with cerebral palsy for 708 individuals born with cerebral palsy in Sweden between 1990 and 2005.
- 9.2 The statistical analysis of the Westbom paper was performed with respect to GMFCS level and gastrostomy feeding, though survival curves were presented only for GMFCS (Level V) individuals:
- 9.3 The relevant statistics from the Westbom paper are replicated below:

10 Reid et al (2012)

- 10.1 In their 2012 paper, Reid et al investigated the survival patterns in persons with cerebral palsy for 3,507 individuals born with cerebral palsy in Victoria between 1970 and 2004.
- 10.2 This paper found strong associations of survival rates with degree of intellectual deficit and motor impairment. Individuals were defined according to the following classifications:

Table 10.2 - Reid et al (2012) classification of individuals

Motor impairment	Description
Mild	GMFCS Level I and II - Independently ambulant at 5 years of age
Moderate	GMFCS Level III - Ambulant with the assistance of a hand-held mobility device
Severe	GMFCS Level IV and V - No independent ambulation

- 10.3 The statistical analysis of the Reid paper was performed with respect to motor impairment classification subdivided by the number of additional impairments present from a possible five, comprising epilepsy, severe / profound intellectual impairment ($IQ < 30$), blindness deafness (hearing loss $> 70\text{dB}$), and lack of speech.
- 10.4 The relevant statistics from the Reid paper are replicated below:

11 Touyama et al (2013)

- 11.1 In their 2013 paper, Touyama et al investigated the survival patterns in persons with cerebral palsy for 580 individuals born with cerebral palsy in Japan between 1988 and 2005.
- 11.2 The statistical analysis of the Touyama paper was performed with respect to GMFCS level, birth weight and gestation period, with survival curves presented only for GMFCS (Level V) individuals.
- 11.3 The relevant statistics from the Touyama paper are replicated below:

12 Strauss et al (2014)

- 12.1 In their 2014 paper, Strauss et al investigated the survival patterns in persons with cerebral palsy for 16,440 individuals born with cerebral palsy in California between 1983 and 2010.
- 12.2 This paper found strong associations of survival rates with gross motor function and mode of feeding. Individuals were defined according to the following classifications:

Table 12.2 - Strauss et al (2014) classification of individuals

Motor impairment	Mode of feeding
Does not lift head in the prone position	Tube fed
Lifts head but not chest in the prone position	Fed orally by others
Lifts head and chest, partial rolling	Feeds self orally
Full rolling, does not walk unaided	
Walks unaided	

- 12.3 The statistical analysis of the Strauss paper was performed with respect to gross motor impairment and mode of feeding. Additional analysis was conducted to adjust Kaplan-Meier survival curves to 2010 levels, though for consistency with other studies in this publication, the unadjusted Kaplan-Meier survival probabilities have been used
- 12.4 The relevant statistics from the Strauss paper are replicated below:

- 12.5 The Strauss paper also provides life expectancy calculations, but these are in respect of cohorts of individuals aged 15, 30, 45 and 60 during the interval of study (1983 to 2010).

13 Himmelmann et al (2015)

- 13.1 In their 2015 paper, Himmelmann et al investigated the survival patterns in persons with cerebral palsy for 1,856 individuals born with cerebral palsy in Sweden between 1959 and 2002.
- 13.2 The statistical analysis of the Himmelmann paper was performed with respect to Hagberg classifications (tetraplegia, hemiplegia, etc), SCPE classifications (dyskinetic CP, bilateral spastic CP, etc), GMFCS level, motor impairment, cognitive impairment and epilepsy
- 13.3 The relevant statistics from the Westbom paper are replicated below:

Table 13.3 - Survival probabilities by CP type (transcribed from graph)

14. Reid et al (2018)

- 14.1 In their 2018 paper, Reid et al investigated the epidemiology and length of survival of intellectual disability in cerebral palsy (CP) for 3,248 individuals born with cerebral palsy in Victoria between 1981 and 2010.
- 14.2 As for their previous research, this study found strong associations of survival rates with degree of intellectual deficit and motor impairment.
- 14.3 Intellectual disability was defined as a tested IQ of less than 70 and was typically measured at approximately 5 years of age
- 14.4 The relevant statistics from the Reid paper are replicated below:

15. Blair et al (2019)

- 15.1 In their 2019 paper, Blair et al investigated the survival patterns in persons with cerebral palsy for 3,185 individuals born with cerebral palsy in Western Australia between 1958 and 2011.
- 15.2 This paper found strong associations of survival rates with overall disability score (DISAB) which was consistent with their previous publication and derived by summing the score assigned to the following disabilities: category of movement disorder (hemiplegia = 1, diplegia = 2, other = 3), severity of movement disorder (minimal = 0, mild = 1, moderate = 2, severe = 3), severity of cognitive deficit (IQ 50 to 69 = 1, IQ 35 to 49 = 2, IQ < 35 = 3), other impairments (blindness = 1; bilateral deafness = 1; current epilepsy = 1).
- 15.3 The relevant statistics from the Blair paper are replicated below:

16. Hinwood et al (2022)

- 16.1 In their 2022 paper, Hinwood et al investigated the survival patterns in persons with cerebral palsy for 4,807 individuals born with cerebral palsy in Victoria between 1970 and 2012.
- 16.2 This paper found strong associations of survival rates with degree of motor impairment, as well as the presence of epilepsy, intellectual disability, bilateral deafness, and blindness. Individuals were defined according to the following classification:

Table 16.1 - Hinwood et al (2022) classification of individuals

Motor impairment	Description
